### Test of the water vapor permeability in different climatic conditions

TA 112/ MHN 21.12.2020 Test Report No.

### Customer

Tremco-CPG Germany GmbH Werner-Haepp-Str.1 92439 Bodenwöhr

# **Product**

Testing of the water vapor permeability in different climatic areas according to DIN EN ISO 12572:2001 Sealing: TP654 illmod Trio 1050

# Installation

Sealing tape in test template Joint size 12 mm

# Results

s <sub>d</sub> -Value @23°C	25% r.h.: 0,12 m
according to DIN EN ISO 12572	90% r.h.: 0,07 m
μ-Value @23°C	25% r.h.: 5,83
according to DIN EN ISO 12572	90% r.h.: 3,71
For the individual results, see test	report appendix

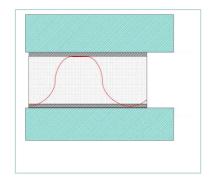

#### **Basics**

#### **DIN EN ISO 12572**:

Hygrothermal performance of building materials and products -Determination of water vapour transmission properties -Cup method (ISO 12572:2016);

#### ISO ISO 12571:2013:

Hygrothermal performance of building materials and products Determination of hygroscopic sorption properties

#### **Application notes:**

This test report serves to demonstrate the abovementioned system properties and relates exclusively to the described and tested system set-up

#### Content

The Report includes 8 pages

- Cover page
- Execution

# 1 Object

# 1.1 Test object

Items manufactured by CPG Europe include joint sealing tapes for sealing joints in building construction. The finished product, which was tested here, is sold under the name "TP654 illmod Trio 1050".

Table 1

Sealing tape	Tape width	Joint size
TP654 illmod Trio 1050 58/6-15	58mm	12mm

# 1.2 Test specimen description

For the test, a test template with a joint size of 12mm is used. The depth of this test template is 20mm. The joint sealing tape must be matched to this test template.

The test template is used together with testing cups and different sorbents depending on the test climates.

The joint sealing tape **TP654 illmod Trio 1050** was cut to 20mm width to contain exactly one barrier layer.

Figure 1: testing cup with Silicagel sorbent (left) and test template (right)

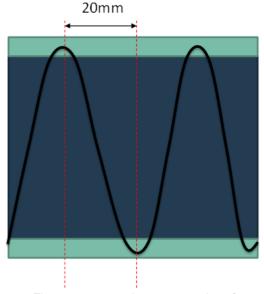

Figure 2: test specimen preparation of TP654 illmod Trio 1050

### 2 Test Execution

## 2.1 Explanation of the test methods

The test specimen is sealed to the open side of a test cup containing either a desiccant (dry cup) or an aqueous saturated solution (wet cup). The assembly is then placed in a temperature and humidity controlled test chamber. Because of the different partial vapour pressure between the test cup and the chamber, a vapour flow occurs through permeable specimens. Periodic weighings of the assembly are made to determine the rate of water vapour transmission in the steady-state.

Pre-treatment: min. 6 hours at 23 (+/-5)°C, 50 (+/-5)% rel. humidity conditioning

Test equipment: test of water vapor permeability in a climate chamber, determination of the mass

variation with precision balance

Procedure: In accordance with DIN EN ISO 12572, the test templates with the specimens are

placed on the opening of the test cup and sealed at the sides. The test cup contains the sorbent suitable for the respective climatic condition. The water vapor permeability is determined by weighing the test specimens at regular

intervals (gravimetric method).

Figure 3: TP654 specimen with sealed testing cup

Table 2: Climatic condition

Climatic condition	Sorbent / rel. Humidity	Climatic chamber rel. Humidity [%]	Temp. [°C]
23°C and 25% rel. humidity	silica gel / 0%	50%	23°C
23°C and 90% rel. humidity	Disodium hydrogen phosphate / 95%	85%	23°C

# 3 Individual results

# 3.1 Climatic condition 23°C and 25% relative humidity

Differential climate: 23 (+/-5)°C; 0/50 (+/-3)% rel. humidity

Sorbent: silica gel with humidity indicator 0% r. h.

Climatic chamber: 50% r. h.

Average air pressure: 1016 hPa

Joint size: 12 mm

Thickness: 20 mm

Average area: 880,152 mm<sup>2</sup>

Direction of vapor flow: corresponding to water vapor partial pressure gradient from the test

chamber to the test cup

Table 3: Climatic condition 23°C and 25% relative humidity

Samplenr.:	Density of water vapour flow rate [g [kg/(m²*s)]	μ	s <sub>d</sub> [m]	climate
TA112-1	2,45E-06	5,57	0,11	0%/50%, 23°C
TA112-2	2,22E-06	6,16	0,12	0%/50%, 23°C
TA112-3	2,37E-06	5,75	0,12	0%/50%, 23°C
MEAN	2,35E-06	5,83	0,12	

# 3.2 Climatic condition 23°C and 90% relative humidity

Differential climate: 23 (+/-5)°C; 85/95 (+/-3)% rel. humidity.

Sorbent: Disodium hydrogen phosphate 95%

Climatic chamber: 85% r. h.

Average air pressure: 1016 hPa

Joint size: 12 mm

Thickness: 20 mm

Average area: 873,025 mm<sup>2</sup>

Direction of vapor flow: corresponding to water vapor partial pressure gradient from the test cup to

the climatic chamber

Table 4: Climatic condition 23°C and 90% relative humidity

Samplenr.:	Density of water vapour flow rate [g [kg/(m²*s)]	μ	s <sub>d</sub> [m]	climate
TA112-4	7,44E-07	3,68	0,07	95%/85%, 23°C
TA112-5	6,56E-07	4,17	0,08	95%/85%, 23°C
TA112-6	8,34E-07	3,28	0,07	95%/85%, 23°C
MEAN	7,45E-07	3,71	0,07	

### 3.3 Conclusion

The test of the water vapor permeability of the **TP654 illmod Trio 1050** according to DIN EN ISO 12572 results in the following average values of the water vapor diffusion-equivalent air layer density  $s_d$  for the two climatic zones

Table 5: Results

climate	test conditions	μ	s <sub>d</sub> [m]
23°C and 25% rel. humidity	23 (+/-5)°C; 0/50 (+/-3)% r.H.	5,83	0,12
23°C and 90% rel. humidity	23 (+/-5)°C; 85/95 (+/-3)% r.H.	3,71	0,07
